구멍가게 코딩단

코드로 배우는 리액트

9. 리액트 소셜 로그인

9장. 리액트 소셜 로그인

- 현재 앱과 웹에서는 전통적인 회원가입 방식 대신 소셜 로그인(구글, 네이버, 애플, 페이스북 등)이 흔히 사용됨
- 리액트와 API 서버를 활용하여 카카오 서비스의 소셜 로그인을 호출
- API 서버에서 사용자의 인증 정보를 기존 회원 데이터와 연동

개발목표

- 1. 소셜 로그인 방식의 이해
- 2. 카카오 로그인을 위한 설정
- 3. 리액트에서 사용자 인증
- 4. API 서버의 사용자 처리

Index

- 9.1 소셜 로그인과 OAuth2.0
- 9.2 카카오 연동 설정
- 9.3 리액트에서 카카오 로그인
- 9.4 API 서버에서 Access Token 처리
- 9.5 자동 회원 추가 및 회원정보의 반환
- 9.6 회원정보 수정

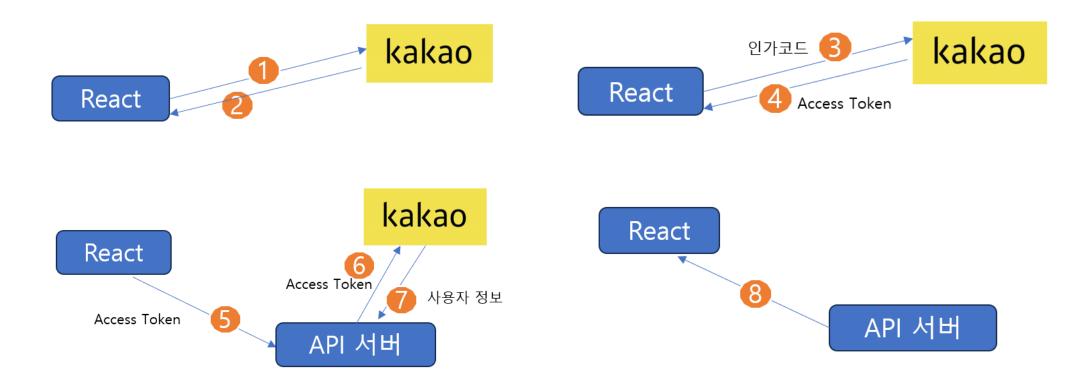

OAuth2.0

- → 다양한 상황에 맞게 사용자의 권한을 부여하는 방식을 제공
 - 권한부여 승인 코드 방식(Authorization Code Grant)
 - 암묵적 승인 방식(Implicit Grant)
 - 자원 소유자 자격증명 승인 방식(Resource Owner Password Credentials Grant)
 - 클라이언트 자격증명 승인 방식 (Client Credentials Grant)

구현 방식

→ 카카오나 네이버 서비스는 '권한부여 승인 코드 방식'

5 / 코드로 배우는 리액트

스토어 설정

→ src 폴더내에 store.js 파일을 추가

```
Js reportWebVitals.js
Js setupTests.js
Js store.js

• .gitignore
{} package-lock.json
```

```
import { configureStore } from '@reduxjs/toolkit'
export default configureStore({
  reducer: { }
})
```

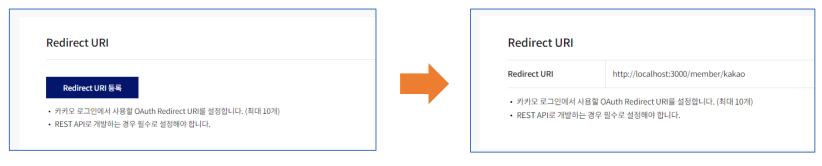

- ① '카카오 개발자' 사이트(https://developers.kakao.com/)에서 '내 애플리케이션'을 추가
- ② 로그인 후에 '애플리케이션 추가하기' 메뉴를 선택
- ③ 애플리케이션 추가 시에는 필요한 기본적인 정보를 입력/저장
- ④ '앱 키'들이 생성되면 이 중에서 'REST API키'를 사용
- ⑤ 카카오 로그인을 수행하는 플랫폼을 설정할 때는 Web을 선택
- ⑥ Web 플랫폼 등록에서는 서버 주소와 포트를 지정하는데, 로컬 환경은 'http://localhost:3000'으로 지정

→ 로그인 동의 설정

→ 로그인 시 동의 항목 설정

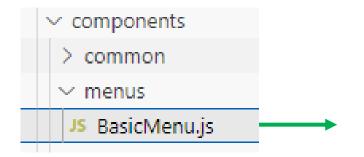

→ 애플리케이션에서 사용할 비밀 키를 생성

로그인 페이지와 로그인

→ BasicMenu.js 컴포넌트

```
import { useSelector } from "react-redux";
import { Link } from "react-router-dom";
const BasicMenu = () => {
  const loginState = useSelector(state => state.loginSlice)
  return (
  (nav id='navbar' className=" flex bg-blue-300")
   …생략
    div className="w-1/5 flex justify-end bg-orange-300 p-4 font-medium">
         \div className="text-white text-sm m-1 rounded" \rangle Login \langle / div \rangle
    </div>
  </nav>
export default BasicMenu;
```

→ 동의 화면과 로그인 화면 인가 코드를 처리

쿼리 파라미터 🕥			
이름	타입	설명	필수
client_id	String	앱 REST API 키 [내 애플리케이션] > [앱 키]에서 확인 가능	0
redirect_uri	String	인가 코드를 전달받을 서비스 서버의 URI [내 애플리케이션] > [카카오 로그인] > [Redirect URI]에서 등록	0
response_type	String	code로 고정	0

→ api 폴더에 kakaoApi.js 파일을 추가

```
✓ api

Js kakaoApi.js

Js memberApi.js
```

```
const rest_api_key = `0a1d9f042.....435bd01b571b1e00` //RESTF|Zt
const redirect_uri = `http://localhost:3000/member/kakao`

const auth_code_path = `https://kauth.kakao.com/oauth/authorize`

export const getKakaoLoginLink = () => {
    const kakaoURL =
    `${auth_code_path}?client_id=${rest_api_key}&redirect_uri=${redirect_uri}&rest_api_key}eredirect_uri=${redirect_uri}&rest_api_key}eredirect_uri=${redirect_uri}&rest_api_key}eredirect_uri
```

→ components/member > KakaoLoginComponent.js 추가

```
import { Link } from "react-router-dom";
import { getKakaoLoginLink } from "../../api/kakaoApi";
const KakaoLoginComponent = () => {
 const link = getKakaoLoginLink()
 return (
 〈div className="text-center text-blue-500"〉로그인시에 자동 가입처리 됩니다〈/div〉
   div className="flex justify-center w-full">
     <div
     className="text-3xl text-center m-6 text-white font-extrabold w-3/4 bg-yellow-500
shadow-sm rounded p-2">
       <Link to={link}>KAKAO LOGIN</Link>
     </div>
   </div>
 </div>
export default KakaoLoginComponent;
```

→ 기존의 LoginComponent에 KakaoLoginComponent를 import 해서 추가

```
    ✓ components
    > common
    ✓ member
    JS KakaoLoginComponent.js
    JS LoginComponent.js
    JS LogoutComponent.js
```

```
import { useState } from "react"
import useCustomLogin from "../../hooks/useCustomLogin"
import KakaoLoginComponent from "./KakaoLoginComponent"
…생략
const LoginComponent = () => {
…생략
 return (
  \div className = "border-2 border-sky-200 mt-10 m-2 p-4">
  …생략
        </div>
     </div>
    </div>
    <KakaoLoginComponent/>
  </div>
export default LoginComponent;
```

→ 인가 코드의 페이지 처리

```
✓ pages
✓ member
JS KakaoRedirectPage.js
JS LoginPage.js
JS LogoutPage.js
```

```
import { useSearchParams } from "react-router-dom";
const KakaoRedirectPage = () => {
 const [searchParams] = useSearchParams()
 const authCode = searchParams.get("code")
 return (
    <div>
      ⟨div⟩Kakao Login Redirect⟨/div⟩
     <div>{authCode}</div>
    </div>
export default KakaoRedirectPage;
```

→ 인가 코드의 페이지 처리 : KakaoRedirectPage에 대한 라우팅 설정

```
✓ router

Js memberRouter.js

Js productsRouter.js
```

```
import { Suspense, lazy } from "react";
…생략
const KakaoRedirect = lazy(() => import("../pages/member/KakaoRedirectPage"))
const memberRouter = () => {
 return
  …생략
     path: "kakao",
     element: <Suspense fallback={Loading}><KakaoRedirect/></Suspense>,
export default memberRouter
```

→ https://kauth.kakao.com/oauth/token을 호출

본문 🕥

이름	타입	설명	필수
grant_type	String	authorization_code로 고정	0
client_id	String	앱 REST API 키 [내 애플리케이션] > [앱 키]에서 확인 가능	0
redirect_uri	String	인가 코드가 리다이렉트된 URI	0
code	String	인가 코드 받기 요청으로 얻은 인가 코드	0
client_secret	String	토큰 발급 시, 보안을 강화하기 위해 추가 확인하는 코드 [내 애플리케이션] > [보안]에서 설정 가능 ON 상태인 경우 필수 설정해야 함	Х

→ Access Token 호출

```
✓ api

Js kakaoApi.js

→
```

```
import axios from "axios";
const rest_api_key =`a09fff59f94e18······.ba7c87d00` //REST키값
const redirect uri = http://localhost:3000/member/kakao`
const auth_code_path = `https://kauth.kakao.com/oauth/authorize`
const access token url =`https://kauth.kakao.com/oauth/token` //추가
export const getKakaoLoginLink = () => {
 const kakaoURL =
`${auth_code_path}?client_id=${rest_api_key}&redirect_uri=${redirect_uri}&re
sponse type=code`;
 return kakaoURL
```

→ Access Token 호출

```
✓ api

Js kakaoApi.js

→
```

```
export const getAccessToken = async (authCode) => {
  const header = {
   headers: {
     "Content-Type": "application/x-www-form-urlencoded",
 const params = {
    grant_type: "authorization_code",
    client id: rest api key,
    redirect_uri: redirect_uri,
    code:authCode
 const res = await axios.post(access_token_url, params , header)
 const accessToken = res.data.access_token
 return accessToken
```

→ KakaoRedirectPage : 인가 코드가 변경되었을 때 getAccessToken()을 호출하도록 변경

```
✓ pages✓ memberJS KakaoRedirectPage.js
```

```
import { useEffect } from "react";
import { useSearchParams } from "react-router-dom";
import { getAccessToken } from "../../api/kakaoApi";
const KakaoRedirectPage = () => {
  const [searchParams] = useSearchParams()
  const authCode = searchParams.get("code")
  useEffect(() => {
    getAccessToken(authCode).then(data => {
      console.log(data)
  }, [authCode])
  return (
   <div>
     ⟨div⟩Kakao Login Redirect⟨/div⟩
    <div>{authCode}</div>
   </div>
export default KakaoRedirectPage;
```
